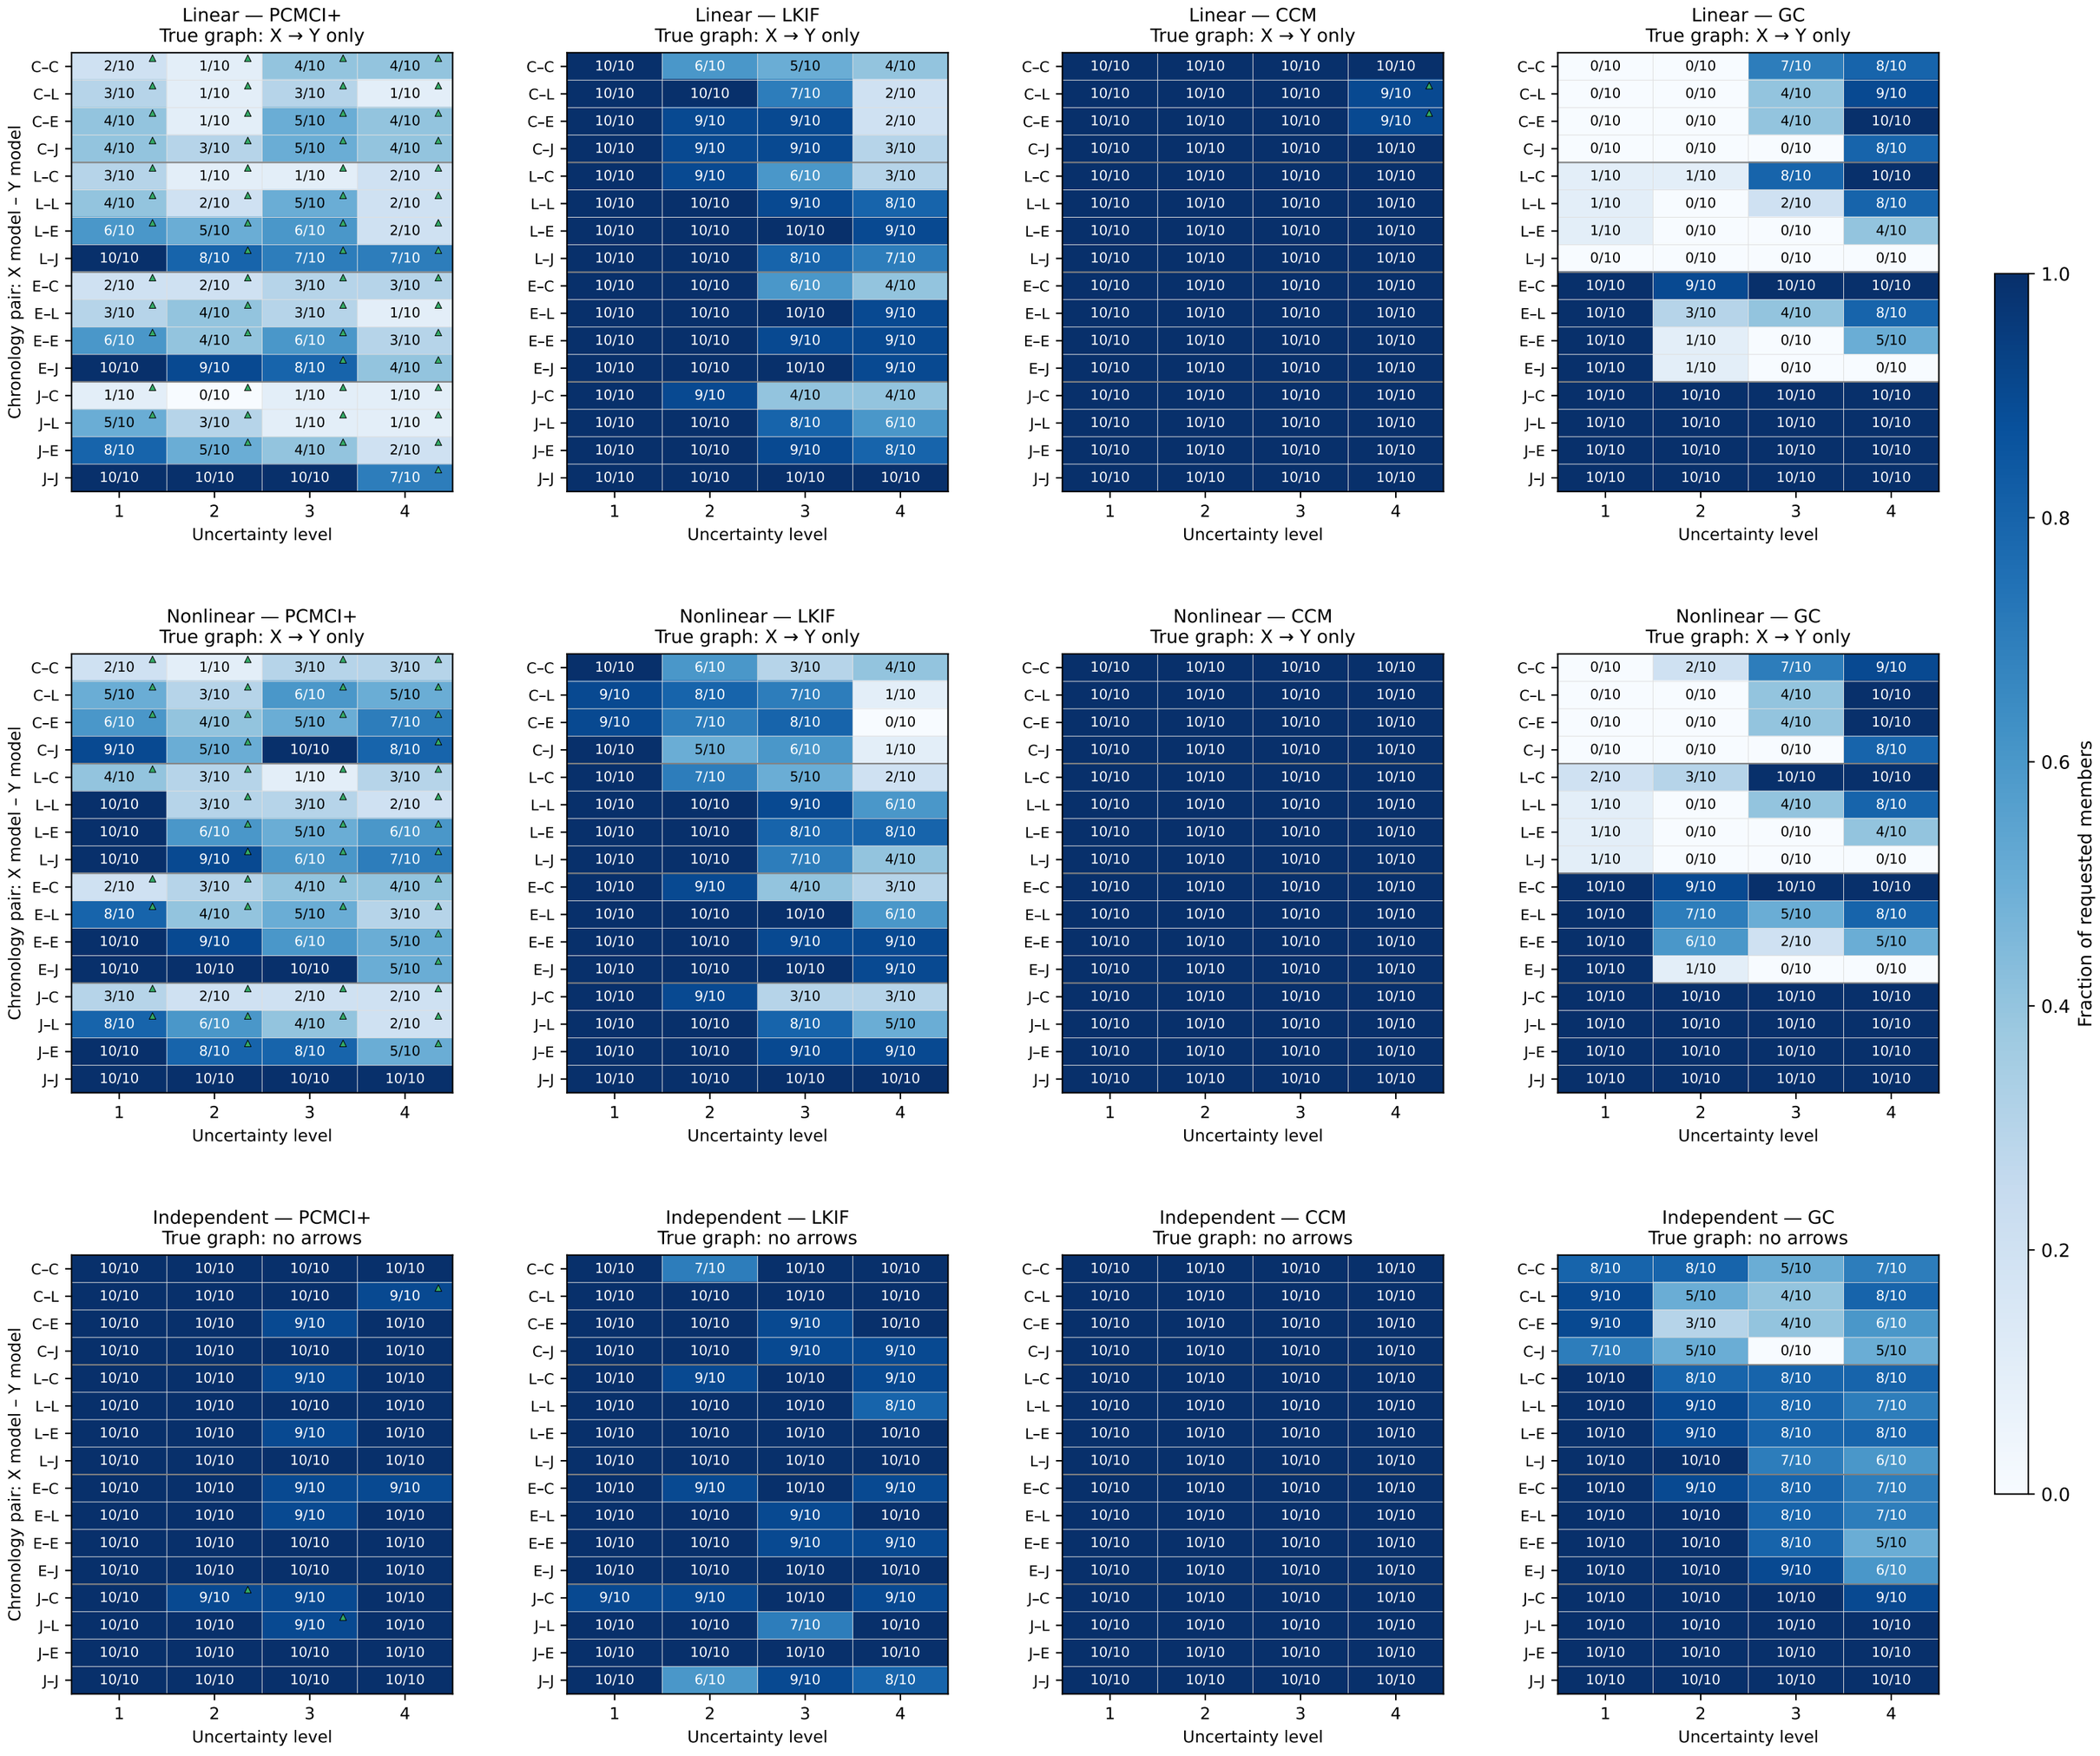
Complete true-graph recovery
All four levels complete

Level: C/L/E peak SD / J coverage — 1: 10 yr / 1 peak (10%); 2: 20 yr / 3 peaks (30%); 3: 40 yr / 5 peaks (50%); 4: 80 yr / 7 peaks (70%)

J peak SD stays 10 yr; coupled-model true lag = 20 yr; 10 requested chronology members per scenario; CCM lag screening enabled.



Cells show correct / requested members. Unresolved and unusable members do not count as recovered graphs; their separate counts are saved in the summary table.

Unresolved means an unoriented contemporaneous link (PCMCI+) or an inconclusive lag screen (CCM). A dash means not calculated, not absence of an arrow.

These are chronology-ensemble summaries for one record per process, not calibrated accuracy estimates across independent climate histories.
